

Forklift Grapples

Forklift Grapple - Grapples work in conjunction with the crowning operation of the bucket cylinder positioned on the excavator. They can mount directly onto the jib or whichever quick hitch that is in bucket position. Grapples are most often used for the handling and processing of timber, construction materials, domestic and aggregate waste items. The grapple's boxed design has added support bridging. This particular manufactured design provides the grapple with utmost strength and support by means of stopping the body from breaking and rotating throughout its function.

The grapple along with all of its moving parts are constructed of hardened steel. The pivot points are designed in order to guarantee supreme closing force and holding ability. The person operating it has the capacity to handle all sizes and varieties of materials using the jaws built-in at the end part of the grapple with toes. This enables the jaws to be able to close through one another in a finger configuration for utmost handling capacity.
